

## **Case Presentations of CNV in CSC (Roundtable discussion)**

Professor Magdy Moussa

Tanta University, Egypt

Through multiple case presentations, we will discuss the role of SS-OCT angiography in detecting CNV in cases of chronic CSC not detectable by other imaging modalities. CNV is suspected under small undulating RPE detachment (flat irregular RPED) on B scan even with complete resolution of serous macular detachment. The discussion will be directed towards the appropriate treatment modalities to achieve better visual outcome for such cases.
